

## ABSTRACT

A flexible vehicle fluid container holds vehicle fluid, which is poured therefrom into a fill opening for vehicle fluid. The container preferably has a nozzle, to which is coupled a first end of a hose, the second end of which is positioned proximate (and preferably within) a vehicle fluid fill opening. The vehicle fluid may be, for example, brake fluid, motor oil, transmission oil, power steering fluid, or other fluids required for the care, maintenance, and/or cleaning of a vehicle. Preferably, the container may be attached to an object during filling, such as a vehicle hood or a mobile carrier.
